- Device for producing castings out of fusible or dispersible base material, including an injection unit from which the at least partially liquefied material can be injected into a mold,
- wherein the injection unit has an inlet port for feeding the material, and wherein the injection unit has a chamber with two movable walls which may as desired be moved either together in the same direction or in opposite directions so that the cavity of the chamber may be varied by volume as desired and/or be displaceable,

one of the two walls forming a section of the wall delimiting the mold cavity (9),

characterized in

that the two walls each form a part of the walls delimiting the mold

one of the two walls being movable into the mold (2).

- 2. Device according to claim 1, characterized in that the wall which is movable into the mold (2) is designed as a piston (8) which is supported within a tubular chamber wall so as to be longitudinally movable or is supported so as to be movable toward chamber (5) to perform a sealing function, and that this wall is movable together with a movable mold section (11) of mold (2).
- 3. Device according to claim 1, characterized in that the wall which is movable into mold (2) is designed to partially determine the surface shape of the casting.
